Luan Magalhães

Senior Software Engineer · Full Stack and AI

Brazil, remote (UTC-3) · magalhaaes@gmail.com · linkedin.com/in/luan-magalhaes-dev · github.com/luanmagalhaes

Senior software engineer working full stack since 2021, on products for European companies (Denmark and Germany) and for a credit marketplace in Brazil. I learned to build software before AI coding tools became common, writing everything by hand: architecture, tests, code review and debugging concurrency bugs. Today I use AI to speed up development, with Claude Code and parallel agents, and inside the product, with LLM-based conversation analysis, tool-using agents and MCP servers. I work close to clients, from gathering requirements to a working prototype in production within a few days. Proficient English (C2): I taught English for five years and studied at the University of Manitoba, Canada, on a selective scholarship program. Internet Systems Development degree (2025), MSc from the Federal University of Bahia and former speech-language pathologist.

SKILLS

Engineering	Clean Architecture and DDD · micro-frontends and microservices · code review and mentoring · concurrency and idempotency · testing with Vitest, Jest, Testing Library, supertest, Playwright and Cypress
AI	Claude Code (multi-agent workflows, subagents, skills and hooks) · Anthropic SDK · OpenAI and Azure OpenAI · tool use and agent loops · MCP (servers in Python and TypeScript) · LangChain.js and LangGraph · LangFlow · Vercel AI SDK and AI Gateway · Whisper · structured output with Zod · prompt caching · Lovable and v0 for prototyping
Front-end	TypeScript · React 18 and 19 · Next.js 14 to 16 · Tailwind 4 · MUI · Radix and shadcn · Storybook · next-intl · micro-frontends with Module Federation · SSR and technical SEO · Angular
Back-end	Node.js · NestJS · Express · Python · Django and DRF · Celery · Go · PHP · REST · GraphQL · OpenAPI
Data and infra	PostgreSQL (triggers, advisory locks) · Prisma · Supabase (Realtime, RLS) · Redis · Docker · Azure (AKS, APIM, Pipelines) · Vercel · Coolify · GitHub Actions · AWS
Integrations	Asaas (PIX, cards and payment split) · Shopify Admin API · WhatsApp Cloud API · Clerk · 100ms · Google Calendar and Meet · server-side GA4 · PostHog · Better Stack · SendGrid · Resend

EXPERIENCE

Antecipa Fácil — Full-stack software engineer

Dec 2022 to present · Brazil, remote

Credit marketplace where companies sell their receivables through a reverse auction among funders.

- Built the customer app from scratch, where I am the largest contributor, and the core back-office modules.
- Built LLM analysis for the chat between companies and funders (summary, sentiment, suggested replies and compliance alerts), with fallback from Azure OpenAI to Claude when the content filter blocks a request.
- Split the chat out of the Django monolith into a microservice with service-to-service auth, Celery and Azure APIM routing.
- Delivered the new onboarding end to end from the Lovable prototypes: around 40 screens, Google and Microsoft sign-in, document OCR, backend endpoints, tests and PostHog events, all behind feature flags.
- Redesigned the v2 front-end architecture with Clean Architecture and DDD. The migration doubled the company's revenue.
- Introduced Husky, ESLint, Storybook, Vitest and Playwright to the front-ends and wrote around 130 test files.

Next.js · React · TypeScript · Python · Django and DRF · PostgreSQL · Celery · Azure · OpenAI · Anthropic · PostHog

Miinto — Frontend Engineer

Feb 2025 to Aug 2026 · Denmark, remote

Fashion marketplace connecting independent boutiques and brands with customers across Europe.

- Maintained and extended the React design system (Stitches, Radix, Storybook, Jest) used by the store's micro-frontends.
- Redesigned the product listing page (filters, in-filter search, price filter, sorting and mobile version) and the account area (sign-up, login and profile), integrated with server-rendered Go micro-frontends.
- Handled technical SEO on the Go-rendered pages, with indexing rules for pagination and filter combinations, and the legal content across 12 sales channels.
- In the Module Federation back office, delivered the order email history end to end, with preview and resend.

React · TypeScript · Go · Stitches · Radix · Storybook · Module Federation · Jest

The Vintage Bar — Frontend Engineer

Aug 2024 to Feb 2025 · Denmark, remote

Luxury fashion marketplace, now part of Miinto.

- Built dynamic filters, inventory management and backend integrations with Angular, TypeScript, PHP and Shopify.

EARLIER EXPERIENCE

- **Engel & Völkers**, Berlin, remote (2022): Smart Money homepage in React, GraphQL, DatoCMS and Auth0, migrated to Next.js.
- **Taghos Tecnologia** (2021): subscription checkout for the Paulistão Play streaming service in React, TypeScript, Formik and Cypress.
- **Healthcare and teaching** (2011 to 2021): speech-language pathologist in neonatal, pediatric and adult ICUs and English teacher at CCAA (2011 to 2016). In 2020, as product owner, I led a patient follow-up PWA (React and Firebase).

CONTRACT CLIENT PROJECTS · 2026

Online course checkout for a driving school, live in 10 days

In the client presentation we changed the plan together: sell the course first and test demand before building the class platform.

- SSR landing page and Asaas checkout (PIX and card) with commission split, order bump, idempotent webhook and refund and chargeback alerts.
- Sales were not showing up in Google Ads. I moved conversion tracking to the server, fired by the payment webhook (GA4 Measurement Protocol, deduplicated per transaction), and fixed it in one day.
- Sales reports in Google Chat and 28 video testimonials subtitled with Whisper running locally, delivered the same day.

AI agent for B2B orders at an e-commerce brand (Apr 2026)

- Mapped the pain points of the operation and turned the manual process into 7 agent tools: read orders from email, extract PDF and Excel files, check stock and create a Shopify draft order, with human review before confirmation.
- Delivered the prototype in 5 days with the Anthropic SDK, streaming the agent's activity live over SSE, plus a second version in LangGraph to compare both approaches.

Live class platform (SaaS), as lead developer

- Agreed priorities with the product owner, handled deploys and merges, and mentored a junior developer through tasks and code review.
- Rebuilt the 100ms video room as a Vite sub-app with React 18 on the same domain, so it could run alongside React 19 and have its interface translated.
- Pre-enrollment flow with WhatsApp notifications (Cloud API) and automatic activation once Asaas confirms payment, affiliates paid through payment split, roles with Clerk as the single source of truth, and monitoring with PostHog and Better Stack.

Multi-tenant e-commerce ERP, as front-end lead

- The product owner codes with AI and opens PRs with the idea working. I integrate and refine them to the project's standards.
- Translated the app into English and Mandarin with 17 AI agents in parallel, one per area of the code: 2,569 keys, with parity checked by script and a green build.
- Migrated the front-end, which read the database directly (45 tables), to the NestJS API with types generated from OpenAPI, and wrote the backend modules and SQL scripts for the migration.
- Fixed sessions dropping because refresh tokens were rotated by parallel requests, with a single refresh shared across requests.

Also: landing page with a calculator and customer portal for a pool company, shown to the client on the day it was requested.

APPLIED AI AND SIDE PROJECTS

- **Pataka** (in development, with a partner): follow-up for speech therapy patients between sessions, over WhatsApp. Pipeline on the Anthropic SDK with a router (Haiku), a generator (Opus) and a reviewer that rejects or rewrites the answer, Zod-validated output, prompt caching, a deterministic safety filter and audio transcription with Whisper.
- **MCP servers**: one in Python (FastMCP, stdio and token-authenticated HTTP) to log work hours through Claude, one in Node that syncs a bug board with Notion, and a media brief analyzer with a LangGraph agent using its own MCP server.
- **Custom Claude Code setup**: a subagent that challenges the proposed solution with evidence from the repository before any code is written, a hook that uses the TypeScript compiler to block forbidden patterns, PR workflow skills and verification workflows with more than 100 subagents.
- **7 apps live**, each built in 2 to 9 days from first commit to deploy (Next.js 16, Supabase, Vercel and around 750 tests):

Vitrola	music game with Deezer previews	a-vitrola.vercel.app
Cantarolá	team party game with live microphone audio	cantarola.vercel.app
Não Vale	forbidden words, the judge sees the card on their phone	nao-vale.vercel.app
FLOW	3 to 12 players, each on their own phone	flow-seven-amber.vercel.app
De Fininho	secret phrases to sneak into the conversation	de-fininho.vercel.app
Flip Score	scoreboard for card game nights, with player photos	flip-score.vercel.app
La Cuentita	bar bill math for a card game night	la-cuentita-green.vercel.app

I also built private apps for my own routine, with no public link: **Reps**, a workout tracker with a dashboard for my personal trainer and a rest timer that alerts with the app closed; **Matilda**, baths, vaccines, food and expenses for my dog, with PIN access and per-tab permissions; **Washing Issues**, a prototype for my building's laundry where residents send their list with photos and the staff logs washing and pickup; **Game Night**, for our game nights, with guests, attendance, games and photos; and **Regalo**, a gift list for our group of friends.

EDUCATION

Internet Systems Development (technologist degree), Unicesumar (2025)

MSc in Interactive Processes of Organs and Systems, Federal University of Bahia (2022)

University of Manitoba, Canada: Health Sciences exchange on a selective scholarship program, with an intensive English course (2014 to 2015)

BSc in Speech-Language Pathology, State University of Bahia (2015)

LANGUAGES

Portuguese, native

English, proficient (C2)

Italian, basic
